Portfolio: iamrajkumar1.github.io/portfolio

Profile

Software Engineer (AI/Backend) at a startup, moving between LLM products and production APIs as the work requires. Lead developer on a ~INR 4 crore US-client Salesforce integration. Also shipped RAG precedent search on the Microsoft marketplace and a 41-table FastAPI platform.

Skills

AI: RAG, LLMs, agentic workflows, tool calling, Azure OpenAI, GPT-4, GPT-4o-mini, embeddings, reranking, grounding, prompt engineering, OCR
Backend: Python, FastAPI, REST, PostgreSQL, MongoDB, SQL, SQLAlchemy, Celery, Redis, JWT, RBAC, AsyncIO, Docker, GitHub Actions
Integrations: Salesforce Apex, HMAC webhooks, OAuth 2.0, Microsoft SaaS marketplace, Razorpay, Azure AI Search, Azure Document Intelligence, eCourts, Qualtrics, Tripleseat
Languages: Python, SQL, Apex, C++, C, JavaScript, Java

Experience

Software Engineer (AI/Backend) | AIOrdinate **Nov 2025 – Present**

Remote

- **Lead developer, SF Giants, June 2026 – October 2026:** With one architect, built most of the Salesforce–Tripleseat sync for a US client: HMAC webhooks, OAuth 2.0, a claim queue, 2-minute dedup, and HTTP 429 retry. About an INR 4 crore engagement, AIOrdinate's highest-value project. The client accepted the production deliverables.
  - Routed each request to Prospect, Waitlist, Tentative, or Definite with a 90-day lead window, a room-overlap check, and a 48-hour last-minute rule. Account, contact, owner, and manager ids map both ways, including Qualtrics inbound and the room-catalog API.
- **Knowledge transfer:** Wrote the admin docs for the booking path and onboarded junior engineers onto the Giants sync before moving to precedent search.
- **Precedent finder, June 2026 – October 2026:** Built search over full judgments. A question, a saved matter, or an uploaded brief comes back as matching cases with IRAC, ratio decidendi, obiter, arguments for and against, and a 0–100 relevance score.
  - An orchestrator rewrites the query. Embedding search and rerank cover India, the US, the UK, and Australia and return the default 4 judgments from the top 20 chunks. A 40 confidence floor hides weak hits. Analysis retries under 0.30 retrieval or 0.35 grounding.
- **Microsoft marketplace:** Precedent search is sold as a Microsoft SaaS offer. The API does landing, activate, and lifecycle webhooks, then enforces plan entitlements and usage quotas. Direct checkout uses Razorpay. OCR covers 5 files at 10 MB. A 20-document cap stopped HTTP 503s and a shared Postgres pool stopped HTTP 500s.
- **Caseflow, lawyer platform:** Built the FastAPI and PostgreSQL API behind the lawyer product. 41 tables and 140+ routes cover cases, clients, documents, meetings, and tasks, with JWT and role-based access, Celery workers, and Docker plus GitHub Actions deploys.
  - **Annotation and LODE:** Writes PDF bookmarks, a hierarchical index, and annexure references, then embeds them on download. LODE pulls dated events for petitioner, respondent, and neutral context and drops a repeat at an 85% similarity threshold.
  - **eCourt sync:** Added 9 endpoints for CNR lookup, case sync, and court-order PDFs. The scraper reads the captcha image and solves it with Azure OpenAI vision, so the sync continues through the portal challenge.
- **Client portal:** Built the client-side API, 60+ routes for cases, documents, calendar, tasks, and Rocket.Chat. Integrated LexAIO on 13 chatbot routes, with sessions, queries, detected language, confidence, follow-ups, and a share-summary email.
- **LexAIO:** Wired the multilingual agent into both portals. A GPT-4o-mini router picks tools, GPT-4 answers from a law dictionary, Azure AI Search, and eCourts, and the API stores language, confidence, and the follow-up questions.

Technologies: Python, FastAPI, PostgreSQL, Celery, Redis, Azure OpenAI, Azure AI Search, Salesforce Apex, Docker, GitHub Actions.

Software Engineer Trainee | Cisco Systems India Pvt Ltd **Nov 2024 – Nov 2025**

Bangalore

- Built FastAPI create, read, and update endpoints and PostgreSQL schemas for an internal ops dashboard of device records, configs, and status, with request validation and error handling.
- Wrote the SQL for list and filter screens, added JWT login, and debugged failing endpoints and integration tests in Git reviews with senior engineers.

Technologies: Python, FastAPI, PostgreSQL, SQL, REST, JWT, Git.

Projects

DeepDDI – Drug–Drug Interaction Prediction | IIIT Bhubaneswar, 2024

- Implemented three DrugBank interaction models. A SMILES Conv1D baseline reached 71.3% accuracy and 0.709 AUC. RDKit molecular graphs, 79 atom features and 10 bond features, lifted graph convolution to 81.0% accuracy and 0.804 AUC.
- Added Laplacian positional encoding and graph attention. That model was the strongest of the three, at 86.2% accuracy and 0.850 AUC.

Technologies: Python, PyTorch, RDKit, graph attention, Conv1D, DrugBank.

Education

IIIT Bhubaneswar **Dec 2020 – June 2024**

B.Tech, Computer Engineering | CGPA 7.44 / 10
Coursework: Data Structures and Algorithms, Operating Systems, DBMS, OOP, Machine Learning

Achievements

- LeetCode Knight. Solved 500+ DSA problems on LeetCode and GeeksforGeeks.
- Cisco Certified Network Associate (CCNA). Coursera Supervised Machine Learning.
